                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /gene="SCF43.02"

Where possible we choose an initiation
                                                                                                                                                                                                                                                                                     The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS. Usually the highest scoring match found by fasta -o is given for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           overlap, Also similar to several phosphatases e.g. Streptomyces collinus TR:Q9X654(EMBL:AF131877) NapH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            X95703.1 GI:1200138
mel-operon; melC1 gene; melC2 gene; ORF3; RNase H; rnhH gene;
tyrosinase; tyrosinase co-factor.
NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 173434;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Sequencing vector: Plasmid: M7789
Chemistry: Dye-terminator Big Dye: 98% of reads
Assembly program: Phrap; version 0.990329
Consensus quality: 22789 bases at least 040
Consensus quality: 2572b bases at least 030
Consensus quality: 27555 bases at least 020
Estimated insert size: 16593; sum-of-contigs estimation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

sequenced clone. It may be shorter because we only sequence overlapping settions once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid L6586 is not overlapped by any clones sequenced to date. It contains the left end of PAC P460 (AL160762), and the right end of PAC P986
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Where possible we choose an initiation codon (atg) which is preceded by a stretch of pyrimidines or part of a Kozak sequence. If this cannot be identified we choose the most upstream initiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the Hexamer program which was written by Richard Durbin as an integral part of the ACEDB-based analysis tools for the C.elegans Genome Sequencing Project. The program calculates the log-likelihood score for a given DNA segment based on the frequency of 6-mers, normalised for the base-pair composition of the genome. The program was trained using a fasta file of confirmed Leismania major coding sequences (CDS), i.e. from ATG start codon to the stop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CDS are numbered using the following system eg L6586.01. L6586 (cosmid name), .01 (first CDS)

To make the cosmid library Leishmania major Friedlin DNA was partially digested with Sau3Ar prior to cloning into BamHI site of the cosmid shuttle vector CLHYG (Ryan et al. 1993 Gene 131:145-150). The sequence of the packaged vector was determined by Peter Myler and Ken Stuart at Seattle Biomedical Research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Submitted (16-MAR-2001) European Leishmania major Friedlin genome sequencing project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA, (E-mail: barrell@sanger.ac.uk) and Max Planck Institut fuer Molekulare Genetik, Ihnestr. 73, D-14195 Berlin, Germany on Feb 2, 2000 this sequence version replaced gi:4760361.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Details of leishmania sequencing at the Sanger Centre are available

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database.
Gene prediction is done using:

/note="Vector: pBluescript II SK-; Site_1: ECORI; Site_2: Mobil: This library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CC2 and HS medium bubbled with 5% CC2. PolyA mank was purified from each sample, pooled and cDNA synthesized: The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the ECORI (5') and XhoI (3') sites.
                                                                                                                                                                                                                                                                                   ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806." 559 c 637 g 275 t 61 others

Partially Hind III digested and size-selected S. mansoni cercarial
DNA was ligated into Hind III digested pBeloBAC II vector and used
to transform E. coli DH10B. The complete library contains 23808
clones from 4 independent sizing-ligation-transformations. Average
insert size ranges from 70-127 kb and genome coverage is 7.9-fold.
    GSS 08-OCT-2001
                   T7 end of clone 005DC04 of library SmBAC1 from strain Puerto-Rican of Schistosoma mansoni, genomic survey sequence.
